Running the MATLAB GUIs

ASSUMPTION: GUIs are written so that students do not need MATLAB skills, however they do need the basic awareness of how to ensure MATLAB can find the file they wish to run. This file presents some screen dumps of the key steps for those who need this extra clarity.

1. Create a folder on your computer

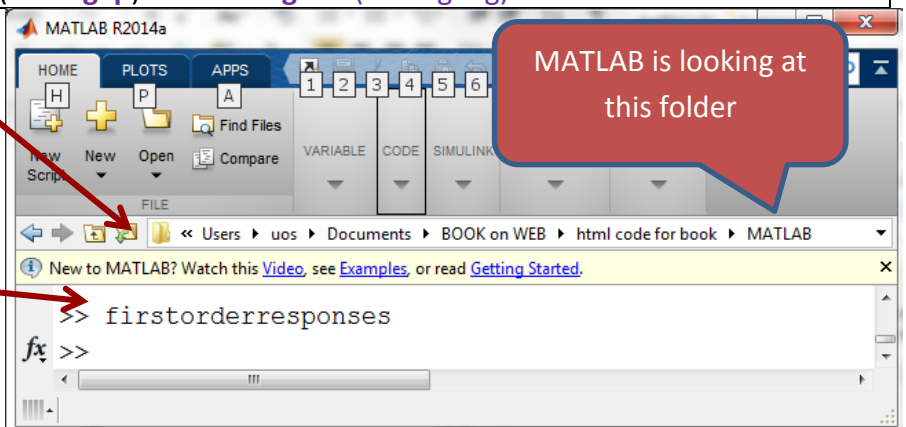

Here I have a folder name for all my MATLAB files linked to the web book.

2. Copy 2 files: the main GUI file (ending .p) and the fig file (ending .fig) to this folder.

3. Move MATLAB to this folder using the browse button.

4. Run the GUI by typing its name in the command window.

To check you are in the correct folder, type `>> what` and it will list the available files.
